For the photograph, I decided to make it black and white. By making it black and white, it made the other colors stand out even more. The part I wanted to most stand out was the light coming off from the laptop screen, and I also wanted the laptop screens light to be pointed at the persons face. I also added some black to the edge of the photo because the person is located in the right center of the photo. The focus of the photo is the person, so by adding the black it further emphasizes the focus. Everything besides the person is part of the background. The black on the sides also matches the persons sweatshirt color; the sweatshirt is the only other dark part of the photo.

This photo was selected because the person was not looking at the camera, instead they were looking at a laptop screen. This also makes the laptop an important aspect of the photo, but the laptop is still not the main point. The laptop does not block any body parts, rather the person is using the laptop as a prop. I did not crop the photo since I liked the random props hanging on the wall in the background. The board and the person makes people pay more attention to the right side. The light from the computer screen is also coming from the left hand side and shining it to the right side. What went well was adjusting the saturation. From adjusting the saturation, I could emphasize what I wanted to emphasize. The yellow and orange light coming from the computer screen creates contrast from the black and white. Something that could have gone better was blurring the background. The edges of the photo has black hues, but I was having issues blurring it.
